## Shopping Centre Surveys in Five States

Showing effects of Site-value Taxation with Exemption of Buildings upon Development of Business Centres of Australian Towns as Reflected in their Modern or Obsolete Appearance.

By A. R. HUTCHINSON, B.Sc., A.m.i.e., Aust. Land Values Research Group.

# Shopping Centre Surveys in Five States Effects of Exemption of Buildings and Site-Value Taxation 

The author is Hon. Research Director, Land Values Research Group.-This body collects, analyses and distributes information relating to the incidenco and effects of public charges imposed upon land tenure.

Municipal finance in Australia is based on local taxation of property according to its value. The municipal units fall into two groups following different principles of application. One group exempts the buildings and cultivation or other improvements, and bascs the rate (or local tax) only upon the bare value of the site itself. The other bases the rate upon the value of the site plus the improvements.

Local taxation on the value of land plus improvements was universal in Australia until 1887. Exemption of improvements was first developed in Queensland and rapidly extended to become the dominant practice over the Commonwealth. Exemption of improvements and taxation of sites has now operated generally in Queensland municipalities for 68 years, New South Wales for 50 years, as also for rural districts of West Australia, and for much shorter but still long periods in South Australia and Victoria. Only in Tasmania has it received no application as yet.

These periods are long enough to warrant expectations of visibly superior development in municipalities following this practice as compared with those where penalties are imposed on improvements. As the whole of our economic life depends upon the multiplication of buildings and other "improvements," a survey was undertaken by the Land Values Research Group to compare the development in places following these radically different policies.

## Nature of Survey.

The principle followed in this survey is the same as that used in agricultural science to compare the effects of new fertilisers on crops. Test fields are planted with the same cereal but one treated with the fertiliser while the other is not. The plants vary greatly in size and yield if compared individually. But these individual variations are swamped out in the average over the whole field, leading to sound conclusions on the effect of treatment.

So if observations were taken over a sufficient number of municipalities under each system and conclusions restricted to the group averages, we could find whether our fertiliser (taxation of sites instead of buildings) produced superior results.

## Modernisation of Shopping Centres the Yardstick.

The best yardstick available to measure the effect of exempting buildings and other improvements is the extent of modernisation or obsolescence of shops in the business centres. Reasons for this are that shops are close together in compact areas which can be easily studied; the effects of competition in bringing modernisation are more rapid than with residential development; there are commonly accepted standards of conformity with shops; the condition of the business community disclosed by a shopping survey will also be a reflection of the conditions of their customers; and simple tests can be applied to assess modernisation or obsolescence of shops.

There are two clear-cut stages of modernisation of shops that can be pin-pointed in Australia. The older and now obsolete types had wood or stone-frame windows and pillar supported verandahs.

First stage of modernisation was to supplant the old with the new metal-framed windows. With these came tiled fronts. Next siage was replacement of the pillar-supported verandahs with modern cantilever types. There are many further refinements of modernisation, but the presence or absence of the two basic stages mentioned has proved quite sufficient to show some startling differences between the municipal groups according to whether they exempt or tax improvements.

Surveys were taken between May, 1956, and May, 1958, in a total of 353 citics and townships in Victoria, New South Wales, Queensland, South Australia and Tasmania. These covered in succession all towns passed through on the main roads traversed and included more than two-thirds of all provincial townships within a band of about 100 miles width and 2,200 miles length, extending from Port Augusta in South Australia to Maryborough in Queensland, with a few additions outside that as well as most Tasmanian towns.

The number of towns studied is large enough to enable reliable conclusions to be drawn from comparisons. These are made in five groups, according to the total number of shops contained in the business centre of the towns.

These groups comprise:-
(1) Major cities with more than 300 shops in the main centre;
(2) cities and towns having between 91 and 300 shops in the main business centre;
(3) towns with 41 to 90 shops;
(4) medium-sized townships with between 21 to 40 shops;
(5) small townships with between 5 to 20 shops.

Each operator was counted irrespective of size, i.e., large emporiums occupying several normal sites were counted as one shop. Only shops with road frontage were counted, others within arcades being ignored. The counts were restricted to recognised type shops and did not include hotels, banks, insurance offices and garages, which have different standards. However, in some cases normal shops were found to be used as temporary offices for banks and insurance firms, and these were counted as shops.

## Classification Code.

Shops were classified as "Modern," "SemiModern," or "Obsolete," according to whichever of the following criteria applied:-
Modern shops which had both metal-framed windows and cantilever verandahs;
Semi-Modern shops with-
(a) metal-framed windows but pillartype verandahs;
or (b) metal-framed windows but no verandahs;
or (c) wood or stone-framed windows and cantilever verandahs.
Obsolete shops with-
(a) wood or stone-framed windows and pillar verandahs.
or (b) wood or stone-framed windows and no verandalis.

## Overall Results.

The table below compares the proportion of shops which are "modern," "semi-modern" or "obsolete" for the average town within these five size ranges. The comparisons are in two sections according to whether buildings are exempt from or subject to local taxes.

* The last column gives a single figure showing the weighted average extent of improvement for the towns as a whole. This is simply the percentage figure for the modern (which have two stages of modernisation) plus half the percentage of the semi-modern (which have only one stage of modernisation).

The modernisation shown in this survey is an overall picture of the pattern whether achieved by actual replacement of the obsolete types or by new buildings of modern type improving the average. For the larger centres it will be predominantly the former-for the smaller centres predominantly new buildings.

For the first four size ranges in towns where buildings are exempt and sites taxed, the proportion of shops in the "modern" class is double,
and the proportion in the "obsolete" class only about half that in the comparable size range still taxing buildings. For the last range containing the smallest size towns the superiority is not so great but is still clear-cut.

The towns in the 5 to 20 shop range are relatively stagnant as shown by the predominance of the "obsolete" classification. The implications of this are that the economic climate of the population served by the shops in these
small towns is too poor to warrant the shopkeepers modernising their premises, or competition to establish new shops which would raise the overall level of modernity.

Where there is keen competition to establish more shops and modernise old ones, it is a clear indication that the volume of business is good and that the economic condition of the customers is sound.

The conclusion is warranted that the "fertiliser" of exemption of buildings from local taxes has had a marked long term effect in producing a superior "crop" of modernisation of business centres in each of the comparable size ranges.

## Numbers of Towns in Size Groups.

The proportion which the numbers of towns in the size groups bear to the totals surveyed are in themselves significant. These are set out below :-

|  |  |  | Buildings Taxed |  | Buildings Exempt |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Range in Number of shops in |  |  | No. of |  | No. of |  |
| business centres. |  |  | Towns | \% | Towns | \% |
| 91 or more shops ... | $\ldots$ | $\ldots$ | 29 | (14) | 45 | (3012) |
| 41 to 90 shops | $\ldots$ | $\ldots$ | 52 | (25) | 45 | (3012) |
| 21 to 40 shops | $\ldots$ | $\ldots$ | 46 | (23) | 28 | (19) |
| 5 to 20 shops ... | $\ldots$ | $\ldots$ | 79 | (38) | 29 | (20) |
|  |  |  | 206 | (100) | 147 | (100) |

Where buildings and other improvements are exempt from local taxes, 61 per cent. of the towns are found to be in the two top groups with 41 shops upwards, while only 39 per cent. have less than 40 shops. Where buildings are taxed the position is completely reversed, with only 39 per cent. in the larger and 61 per cent. in the smaller size range.
This would naturally follow from the observed results of other studies made by the Research Group which show that house (and other) building activity stabilises at a higher level where buildings are exempt and sites taxed than where the opposite course is followed.

This gives a higher level of prosperity with more spending money in the hands of customers where buildings are tax-free.
The inference seems clear that in two-thirds of the towns exempting buildings, customers are numerous and prosperous enough to sustain more than 49 shops by their spending, while only one-third are able to support such a number where buildings are taxed.

## Major Cities Compared.

Some of the most striking comparisons are seen in the major cities with more than 300 Shops, which include the capital cities in the five States.

Number of Shops
Percentages

Those exempting buildings average 85 per cent. in the modern class against only 37 per cent. where buildings are taxed. Every city in the exempt group has a much higher proportion "modern" than has any in the taxed group.
The contrast is even more striking for the "obsolete" category. None of the "exempt" cities have any appreciable proportion of obsolete shops. The group as a whole only averages 2 per cent. This compares with an average of 25 per cent. for the "taxed" group. Thus obsolescence is more than 12 times as great.

The comparatively high proportion "modern" in Hobart and Launceston is due to their adoption many years ago of by-laws outlawing pillar type verandahs. This has some effect in channelling new building to provide cantilevers. Melbourne has more recently adopted a similar by-law. The immediate effect was that pillar verandahs were pulled down but not replaced with cantilevers.

The Melbourne survey was completed in July, 1957. Much modernisation is now in progress as part of a general business building boom largely stimulated by higher valuations and charges imposed under the State Land Tax with consequent pressure for more economic development.

The high proportion of modern shops in central Brisbane is surprising, since pillarsupported verandahs are prominent in the approach through the suburbs to the city and are still being erected in some new suburbs. The reason probably lies in that the whole of Greater Brisbane is one municipal rating unit. As such the rates payable on shop-sites in the main centre (where values are high) are considerable enough to induce economic use. In suburban centres values and rates are too low to bring economic pressure towards improvement.

Towns with 91 to 300 Shops in Main Centre.

| Totals \& Avge | $\ldots$ | ... | 320 | 129 | 109 | 558 | 57 | 23 | 20 | $68 \cdot 5$ |

Streets with less than 20 shops excluded include Campbell and Brisbane.

## Large Provincial Towns.

With the towns in the 91 to 300 shops bracket the proportion of modern averages 61 per cent. where buildings are exempt to 34 per cent. where they are taxed. The obsolete proportion for the former is only 15 per cent. compared to 29 per cent. for the latter.

There is great range between the individual towns in this category. Of those taxing buildings, Shepparton ( 61 per cent.) is the only one to have as high a percentage of modern as the average ( 61 per cent.) of the 40 towns exempting buildings. On the other hand, no fewer
than 12 of those exempting buildings have more than 80 per cent. in the modern bracket.

Of those taxing buildings only Shepparton and Swan Hill had less than 10 per cent. of "obsolete" shops. This compares with no less than 18 of the whole 40 exempting buildings.

It is interesting to note that of the 22 towns taxing buildings 9 had recently or since changed their policy to exempt buildings. The position disclosed in the survey is the cumulative result of the policy of taxing buildings in previous years. These nine towns are: Ararat, Benalla, Castlemaine, Mildura, Sale, Swan Hill, Wangaratta, Warrnambool, Wonthaggi.

## Shop Surveys in Capital Cities.

## MELBOURNE.

Area bounded by Spring, Queen, Flinders and Victoria Streets. Survey was taken in July, 1957.

| July, 1957. |  |  |  | Semi- |  | Total | Mod. | Semi. | Obs. | Overall |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Totals \& Avge. | ... | $\cdots$ | 471* | 456* | 112 | 1,039 | 45 | 44 | 11 | 67 |

The "little streets" (which could not be expected to have full cantilever verandahs with their narrow width), and those with a total of less than 30 shops have been excluded from the above.

* Shops in the section of Collins Street between Russell and Spring Streets (50)—where cantilever or any verandahs are prohibited under by-law-have been counted as Modern due to the restriction though otherwise classed as Semi-Modern under terms of survey.
SYDNEY.
Area bounded by Circular Quay, George Street, Macquarie Street (and extension College Street and Wentworth Street, Pitt Street to intersection with George and to Quay Street. Survey was taken in November, 1956.

| Street | over |  | Mod. | $\begin{aligned} & \text { Semi- } \\ & \text { Mod. } \end{aligned}$ | Obs. | Total Shops | $\begin{gathered} \text { Mod. } \\ \% \end{gathered}$ | $\begin{gathered} \text { Semi. } \\ \% \end{gathered}$ | Obs. \% | Overall $\%$ |

| Totals \& Avge. | $\ldots$ | 311 | 120 | 120 | 551 | 56 | 22 | 22 | 67 |

Streets with less than 20 shops excluded include Cimitiere, Kingsway and Patterson.

## Shopping Centre Survey.-Summary.

A) Where Municipalities Exempt Buildings and Improvements from Local Taxes (U.C.V.).

Percentage of :

| Size of Town |  |  | Number of Towns | Total <br> Shops | Average No. per Town | Modern | Semi- <br> Modern | Obsolete | Overall Modernization |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1. Over 300 Shops | $\ldots$ | $\ldots$ | 5 | 2,822 | 564 | 85 | 13 | 2 | $91 \cdot 5$ |
| 2. Between 91-300 | $\ldots$ | $\ldots$ | 40 | 5,930 | 148 | 61 | 24 | 15 | 73 |
| 3. Between 41-90 | $\ldots$ | $\ldots$ | 45 | 2,699 | 60 | 56 | 25 | 19 | $68 \cdot 5$ |
| 4. Between 21-40 | $\ldots$ | $\ldots$ | 28 | 846 | 30 | 44 | 24 | 32 | 56 |
| 5. Between 5-20 | $\ldots$ | $\ldots$ | 29 | 309 | 11 | 22 | 20 | 60 | 32 |

(B) Where Municipalities subject Builiings and Improvements to Local Taxes (N.A.v.).

Percentage of :

Size of Town

| Number <br> of <br> Towns | Total Shops | Average <br> No. per Town | Modern | Semi- <br> Modern | Obsolete | Overall <br> Modernization |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 7 | 4,443 | 635 | 37 | 38 | 25 | 56 |
| 22 | 2,955 | 134 | 34 | 37 | 29 | $52 \cdot 5$ |
| 52 | 3,166 | 60 | 27 | 33 | 40 | $43 \cdot 5$ |
| 46 | 1,390 | 30 | 20 | 27 | 53 | $33 \cdot 5$ |
| 79 | 889 | 11 | 13 | 16 | 71 | 21 |

Percentage of Overall Modernization is taken as Sum of the Percentage Modern (which have both stages of Modernization), plus half the Percentage Semi-Modern (which have only one stage of Modernization). This gives a Single Percentage indicative of the position for the Group.
